CAD product data

Find your parts online

3D CAD data, technical drawings and data sheets of SKF automatic lubrication system components are now available in native format in the online parts library. In addition to enjoying easy CAD downloads, you can configure more complex lubrication system products and integrate them into your design process – completely free of charge. Integrate CAD data seamlessly into your layout plans without any delay.

Want your machines to perform better? Don't change oil.

What if you could get cleaner oil in your application without having to change it? With RecondOil Box from SKF, you can use the same oil over and over again. In fact, you can get cleaner oil than ever before. Your machines can perform better, and at the same time, your oil can be transformed from a costly CO₂ footprint into a sustainable asset.

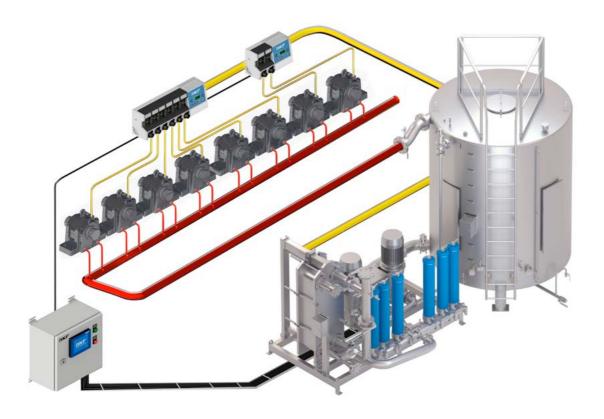

Don't change oil. Change to circular use of oil.

Automatic oil circulation lubrication systems

System description

SKF oil circulation systems are designed to lubricate as well as cool highly stressed bearings in nearly every size of machine. Additionally, the returning oil removes and filters out wear particles from friction points and prevents corrosion damage by removing air and water from bearings. Thus, a continuous oil flow is necessary. SKF oil circulation systems systems include a wide range of customized and turnkey solutions for flow rates from 0,1–3 000 l/min. They are simple to service and feature a modular design that can be expanded easily. Our patented tank design with the SKF plate separator technology increases operating efficiency to up to 90%. An oil supply system delivers the lubricant to the adjustment valves with individual settings. Flow rates can be controlled visually or electronically.

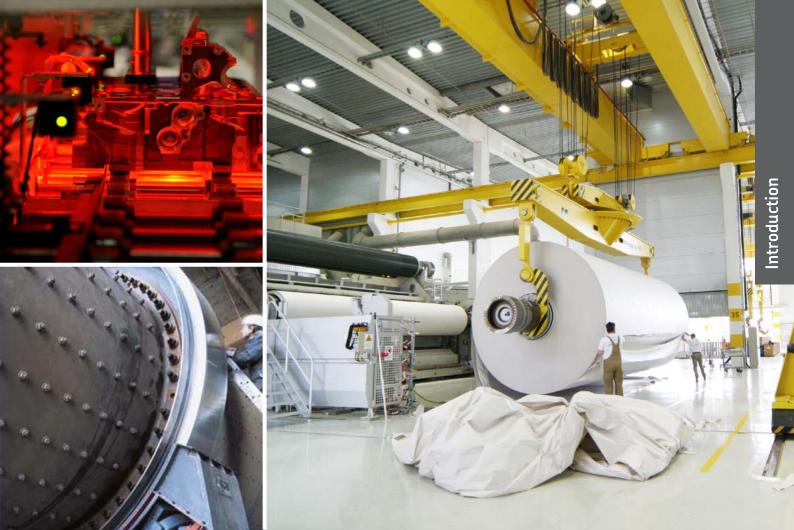

Monitoring systems with a flow rate read-out function and individual warning levels are available for a more predictive maintenance approach.

Oil circulation systems are used in pulp and paper and printing industry, as well as in many other industries. They are also used in heavy industries like marine or tunnel boring. In addition, SKF offers a range of oil circulation EEX components and systems specially designed for operations in harsh conditions and explosive atmospheres like mining or cement mills.

SKF oil circulation system consist of the following components:

- An oil supply unit with oil reservoir and pump unit/station (optionally equipped with filters and oil conditioning units)
- A control device
- One or several monitoring devices
- One or several flow metering devices
- One or several pump units
- · Fittings and pipes

When planning a lubrication system, ambient conditions must be determined first. The number of lubrication points, back pressures at the lubrication points, operating temperature range, the feed pump's drive energy, control and monitoring etc. must be defined correctly. Attention also must be given to bearing or lubrication point information. SKF application engineers as well as SKF sales partners and distributors, are experts in designing lubrication systems according to these specifications. A lubrication system laid out by SKF and partners allows the supply of the correct amount of lubricant at the best time to lubricate. A properly designed lubrication system reduces wear, minimizes pollution caused by over-lubrication and helps to extend machine service life.

System advantages

- · Cools highly stressed bearings
- Removes free water from system
- Bearing flooding protection with integrated control system
- Durable pump series designed for 24/7 operation
- Oil reservoir sizes from 3 to 40 000 liters; (0.79 to 10 567 gal)
- High operating efficiency
- Easy expansion of the lubrication system
- Able to pump long distances and within a wide temperature range

Applications

SKF CircOil lubrication systems are suitable for various industries that operate 24/7. While cooling is the predominant task of these systems, they equally supply bearings and gearboxes with clean oil at the correct temperature and viscosity. Small, highly efficient oil reservoirs provide a high level of machine availability and save money at the same time.

A large variety of flow meters allows for fit-for-purpose solutions and offers state-of-the-art monitoring and digitalization of flow information. Tailor-made controllers support stand-alone operation of SKF oil circulation lubrication systems.

SKF.

MF

Description

MF single-circuit gear pump units are used in small oil circulation lubrication systems with pressure ranges up to 65 bar (940 psi) and high viscosities up to 2 000 mm²/s. The pump is vertically mounted on the reservoir.

MF gear pumps come with integrated pressure relief and venting valves that feed into the internal return oil connection in the adapter flange. In case of trapped air, the venting valve opens. In case of excess pressure, oil is relieved to the return oil connection via the pressure relief valve.

Features and benefits

- Designed for 24/7 operation
- Inexpensive solution
- High viscosity range
- Compact, rugged and reliable design
- Low noise level
- Integrated pressure relief valve and venting valve

Applications

- Machine tools
- Automotive
- Automation
- Textile machinery
- Metal and plastic forming machinery
- Printing

FLMF

Description

The SKF FLM vane pump unit is a simple and reliable solution suitable for usage in small oil circulation systems with low pressure and low viscosity range. Because of its high suction capacity of up to 3 m (the SKF FLM pump unit is often used as a sump pump. SKF vane pumps can deliver both oil and oil/air mixtures and provide a higher suction capability than gear pump units. Two different pump designs of the pump unit are available: one allows the pump to be mounted separately from the reservoir (FLM) and the other allows the pump to be flange-mounted on the reservoir (FLMF) both vertically and horizontally. When installed on the side (horizontally), ensure that the unit is mounted above the maximum lubricant level. Special designs with a sealed flange for mounting below the lubricant level are available on request.

Features and benefits

- Simple, reliable and cost-effective solution
- Low-wear and low-maintenance
- High suction capacity (3 m)
- Designed for 24/7 operation
- Delivers oil and air mixtures
- Fail safe running functions

Applications

- General Industry
- Machine Tools
- Automotive
- Automation

SM

Description

Compact SM oil circulation units can be delivered with 30, 100 or 200 liter painted or Stainless Steel reservoir. These units can provide oil for one or two small machines with a total flow rate up to 20 l/min. The system pressure level is adjusted by variable speed drives (VFD) or with traditional pressure regulating valve. The reservoir is equipped with a heater to control oil viscosity at start up. An optional water or air cooler will reduce the temperature of filtered oil to desired level. The filter cartridge can be changed during operation with by-pass valve included. Systems are available with simple relay control (ST-RCU) or more advanced electronic control unit (ST-2240-CIRC).

Features and benefits

- Energy saving compact oil supply unit for one or two pumps
- · Easy to use, to locate and to install
- Efficient air cooler, special application without cooler
- Compact power supply unit with frequency converters (VFD), available also without power supply
- Compact electronic control system, available also without control

Applications

- Fans, gears, refiners, washers
- Gear boxes and motors
- Presses, rolls, pumps, chippers
- Etc.

Compact oil conditioning unit

OCU

OCU (Oil Conditioning Unit) is an electrically operated oil cooling, filtering, and pumping unit that comes without a reservoir. Usually, the unit is installed close to machines like large gearboxes and bearing housings having an oil bath. OCU removes contamination effectively and reduces oil temperature affecting positively bearing and gear life. Three different OCU models are available, with an air cooler, with a water cooler, and without a cooler where only filtration is needed. Large oil bath volumes can be equipped with oil low-level sensors and instrumentation blocks with temperature and pressure sensors to safeguard system operation. Even small oil circulation lubrication systems can be created by adding flowmeters and control systems. For extremely high oil volumes several OCU units can be installed back to back for fail-safe redundant operation. A number of corrosion-resistant designs for outdoor and off-shore applications shall complete the range.

Features and benefits

- Low noise, high efficiency pump unit
- Reduces wear in gears and bearings by good filtration
- Improves lubrication film and extends machine life
- Increases the service life of oil up to 5 times and more
- Optional available incl. monitoring and power supply unit
- Optional available stainless steel design units
- · Virtually maintenance free

Applications

- Large bearing houses, compressors
- Turbine systems, vacuum pumps
- Gearboxes

Typical combinations

A) OCU unit with water cooler, shut-off valve, clogging indicator, measurement block, thermostatic water control valve, temperature gauge and pressure transmitter

(→ identifier 1, 2, 4, 6, 7)

B) OCU unit with air cooler, shut-off valve, clogging indicator, measurement block, temperature transmitter and pressure gauge

(→ identifier 1, 2, 4, 5, 8)

C) Above models with suitable flowmeter and pressure regulator valve

(→ identifier 11, 3)

Large oil supply unit

Flowline

Description

SKF Flowline is an oil supply unit for oil circulation systems. The unique cylindrical design of the stainless-steel reservoir saves space and allows a much shorter oil rest time, which means that only half of the amount of oil is required compared to traditional reservoirs. The unit also features a perfect arrangement and interaction of pumps, filters, monitoring and smart control devices, resulting in a first-class oil circulation and oil conditioning system. An oil conditioning system that can efficiently reduce contaminants such as abrasive and oxidized particles, air and water. In addition, SKF Flowline units are equipped with reservoir heating to support smooth and a virtually leakage-free machine start-up. Our well proven standard Flowline range can be enhanced with extra fine filters, head space air dryer, oil condition sensors or control unit based on customer need and application. Other essential oil circulation system components like flowmeters, telescopic return line pipes, sump pump units will complete oil circulation lubrication offer.

Features and benefits

- Maintenance friendly
- Oil service life extension
- Up to 50% smaller reservoirs
- Water and energy use reduction
- Reduced wear and tear due to improved oil quality
- Control for automated start-up and early warnings

Applications

- Paper machines
- Continuous casters
- Rolling mills
- Industrial gearboxes
- · Industrial fans

Basic and extended design

Flowline oil supply units are offered in two versions, basic and extended, to simplify selection process and ensure suitability for most common applications met in heavy process industries. Recommended components are carefully selected and system designs are tested for best possible compatibility and performance. However we always consider application and customer needs for best outcome.

High pressure design

Flowline oil supply units are offered with additional oil high pressure unit for journal bearings common on mineral processing ball and bar mills.

SKF.

Large oil supply unit

Streamline

Description

SKF Streamline oil supply units are SKF's customized solution when it comes to oil circulation lubrication systems. They come with reservoir sizes of up to 40 000 liters in both carbon steel and stainless steel and provide equally superior water and air separation properties compared with the SKF Flowline product series. These reservoirs have a rectangular shape and typically require only one-third of the tank volumes of traditional oil tanks. Advanced technology and the unique SKF tank design guarantee the highest possible oil quality and condition.

Features and benefits

- Increased machine availability due to optimal oil treatment
- · Cost savings on oil purchasing, handling and disposal
- Energy savings
- Less environmental impact
- 50% reduction in reservoir size compared to traditional oil tanks
- 80% more air and water removal than traditional oil tanks
- 90% tank efficiency
- · Dimensions can be adapted to machine footprint

Applications

- Pulp and paper industry
- Metals
- Mining
- Industrial gearboxes

M/MF

Description

MF single-circuit gear pump units are used in small oil circulation lubrication systems with pressure ranges up to 65 bar (940 psi) and high viscosities up to 2 000 mm²/s. The pump is vertically mounted on the reservoir.

MF gear pumps come with integrated pressure relief and venting valves that feed into the internal return oil connection in the adapter flange. In case of trapped air, the venting valve opens. In case of excess pressure, oil is relieved to the return oil connection via the pressure relief valve.

Features and benefits

- Designed for 24/7 operation
- Inexpensive solution
- High viscosity range
- Compact, rugged and reliable design
- Low noise level
- Integrated pressure relief valve and venting valve

Applications

- Machine tools
- Automotive
- Automation
- Textile machinery
- Metal and plastic forming machinery
- Printing

Vane pump

FLM/FLMF

Description

The SKF FLM vane pump unit is a simple and very reliable solution suitable for usage in small oil circulation systems with low pressure and low viscosity range. Because of its high suction capacity of up to 3 m (the SKF FLM pump unit is often used as a sump pump. SKF Vane pumps can deliver both oil and oil/air mixtures and provide a higher suction capability than gear pump units. Two different pump designs of the pump unit are available, one allows the pump to be mounted separately from the reservoir (FLM) or the other allows the pump to be flange-mounted on the reservoir (FLMF) both vertically and horizontally. When installed on the side (horizontally), ensure that the unit is mounted above the maximum lubricant level. Special designs with a sealed flange for mounting below the lubricant level are available on request.

Features and benefits

- Simple, reliable and cost-efficient solution
- Low-wear and low-maintenance
- High suction capacity (3 m)
- Designed for 24/7 operation
- Delivers oil and air mixtures
- Fail safe running functions

Applications

- General industry
- Machine tools
- Automotive
- Automation

ZP

Description

ZP gear pumps are manufactured for clockwise (ZP12-2; ZP1) or counterclockwise (ZP1-S1) rotation, with constant direction of delivery. The indicated delivery rates apply to an operating viscosity of 140 mm²/s and a back pressure of 5 bars (72 psi). They allow direct drive. ZP operated by electrical motors are ZM pumps.

Features and benefits

- Designed for 24/7 operation
- Wide viscosity range
- Compact, rugged and reliable design
- Low noise level
- Integrated pressure relief valve and venting valve

Applications

- Machine tools
- General industry
- Printing
- · Metal forming

ZM (single-circuit)

Description

ZM single-circuit gear pump units are used in small oil circulation lubrication systems with pressure ranges up to 30 bar (435 psi) and high viscosities up to 2 000 mm²/s. They consist of a gear pump, a flange, a coupling and an electric motor. The pump design suits mounting separatley from the reservoir or vertically on top of the reservoir. Horizontal flange mounting below lubricant level is not allowed. ZM gear pump units come without integrated pressure relief and venting valves.

Features and benefits

- High viscosity range
- Low noise operation
- High operating back pressure
- Easy system planning

Applications

- Machine tools
- Metal and plastic forming machinery
- General industry

Gerotor pump

143 without motor

Description

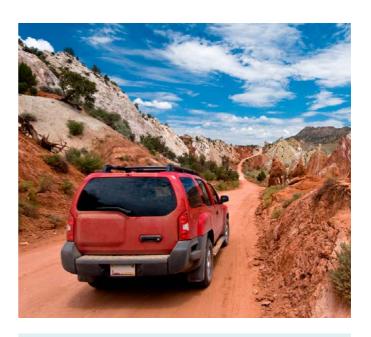

Gerotor pump series 143 are self-priming positive-displacement pumps with fixed displacement and high efficiency. They are suitable for a variety of applications, such as hydraulic, hydrostatic, cooling as well as circulating-oil and total-loss lubrication systems. SKF gerotor pump units of product series 143 are highly efficient and operate in a flow range between 0,85 to 50 l/min at pressure up to 50 bar. They are characterized by very smooth running, low noise generation and good suction capability.

Features and benefits

- Flexible pump delivery range
- Wide viscosity range
- Smooth running
- Low-noise operation
- · Good suction characteristics
- Simplified ordering

Applications

- Marine and offshore industry
- Pulp and paper and printing industries
- Commercial vehicles
- Heavy industry

Gear pump

ZM (multi-circuit)

Description

ZM multi-circuit gear pump units are self-priming and valveless pumps. They are used in oil circulation lubrication systems with 5 to 20 separate delivery circuits. Unused outlets must be returned to the reservoir. The pumps consists of an electric motor, adapter flange, coupling and a gear pump. The pump can be mounted separately from the reservoir or as a flanged pump on the reservoir. A special design with seals for horizontal mounting below lubricant level is available. The fluids to be pumped must have enough lubricity for the pump to lubricate itself.

Some of these distribution pumps require an attached, single-circuit priming pump that operates separately. The priming pump restricts differential pressure within the multicircuit pumps and helps to provide uniform delivery rates. It is advisable to filter the oil upstream of the distribution pump inlet.

Features and benefits

- High viscosity range
- Flexible due to up to 20 circuits per pump
- Suitable for hydrostatic operation
- Easy system planning
- Space-saving pump design

Applications

- Machine tools
- Metal and plastic forming machinery
- General industry

Piston pump

ZPU 09/09A

Description

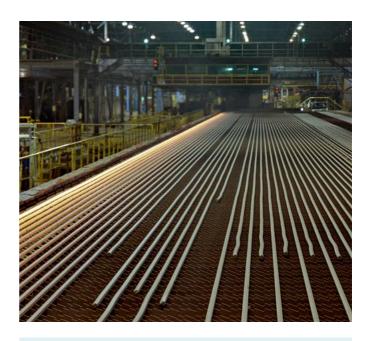

The ZPU 09/09A high-pressure pumps are designed for use in hydrostatic and hydrodynamic (start-up phase) lubrication systems. They also may be used in oil supply systems, blocking oil systems and regulation and control oil systems. The pump is suitable for oils with viscosity of 20 to 460 mm²/s. The pump shows a housing, of 8 l (16.9 pts) capacity, with a pump element and a flange with outlets and return lines, all connected to a 3-phase, multi-range or 500 V motor. The pump can be delivered with one or two outlets.

Features and benefits

- Reliable
- With one or two outlets
- Simple to service
- Built-in check-valve for ZPU 09
- Return line from pressure relief valve
- · Housing integrated oil level indicator

Applications

- Turbines
- Steel mills
- Gears
- Paper machines
- Power stations

Screw-in restrictor

VD

Description

SKF screw-in flow restrictors VD are used to deliver relatively small amounts of oil to lubrication points. Four types of SKF VD are available, differing in tube diameter, flow rate and functionality. VD1 and VD4 restrictors can be combined and fit to manifolds, while VD2 and VD3 can be screwed directly into the ports of individual lubrication points. Screw-in restrictors VD3 and VD4 also come with a check valve to prevent leaks. These inexpensive flow restrictors are sensitive to dirt. Therefore, it is recommended to use a filter size of 10 μm .

Features and benefits

- Easy planning and flow rate regulation
- Flow rate dependent on pressure and viscosity
- Check valve to prevent leaks (VD3, VD4)
- Fitting to manifolds and combination of screw-in restrictors possible (VD1, VD4)
- Direct threading into ports of individual lubrication points possible (VD2, VD3)

Applications

- Machine tools
- Metal industry
- Presses
- Automation
- Industrial transmissions
- Automotive industry
- Heavy industry

Flow divider

SMT

Description

The SKF flow divider SMT1 splits the flow rate into two equal flows or into two individual flows at a specific ratio. Different defined dividing ratios are available from 1:1 to 1:4. Because the SMT1 flow divider regulates itself, varying back pressures have negligible impact on the dividing accuracy. The SMT1 is distinguished by its simple and compact design for installation near the lubrication point. Due to its corrosion-resistant material, it also can be utilized in aggressive environments. Additionally, this flow divider can be used with a wide range of viscosities from 50–1 300 mm²/s.

Features and benefits

- Compact design for installation near lubrication point
- High accuracy due to self-regulating feature
- Corrosion resistant
- Easy flow adjustment (nozzle exchange)
- Inexpensive monitoring through upstream pressure switch or flow controller possible

Applications

- Automotive
- Pulp and paper industry
- On-off road
- Machine tools
- Metal fabrication
- Power plants

¹⁾ Nozzle diameters d1 and d2 need to be determined using a diagram, see brochure 1-5017. Identification code positions A and B are three-digit numbers representing the nozzle sizes. The code for the example would be: d1 0.9 mm) = 090 and for d2 1.4 mm) = 140

Adjustable restrictor

242

Description

The SKF adjustable restrictors 242 are used if a subsequent adjustment of the flow rate is required. The restrictors come in three versions, differing in metering quantity, visual flow indication and number of outlets. Type A flow rates are within the drop-feed range of 0 to 0,01 l/min (0 to 0.02 pts). The adjustable restrictor 242 offers 1 to 14 outlets and a sight-glass for flow rate monitoring. Type B offers continuous metering quantity from 0,01 to 1,0 l/min (0.02 to 2.11 pts) and comes with 2 to 12 outlets. Type C metering quantity ranges from 0,01 to 2,0 l/min (0.02 to 4.23 pts). Depending on the distributor, 2 to 6 outlets are available. Types B and C offer a spring-loaded metal pin in the sight-glass for visual oil flow monitoring.

Features and benefits

- Easy adjustable
- Easy planning and quantity regulation
- Cost-effective visual oil flow monitoring
- Individual regulation of flow range for each lubrication point
- Wide viscosity range

Applications

- Oil and Gas
- · Machine tools
- Metal fabrication
- · Metal forming
- Textiles

SKF Variolub

Description

SKF Variolub SMD flow meters are designed to meter and monitor the flow in oil circulation lubrication systems. They are offered in three different versions covering a flow rate of 0,05 to 40 l/min. The flow meters can be adjusted by a built-in adjustment valve. The meters provide visual and electronic monitoring, and the by-pass system allows adjustment and service, even while the system is running. Due to their modular design, SMD flow meters can be easily replaced, adapted and expanded. They are suitable for machines with several hundred lubrication points and provide reliability and flexibility.

Features and benefits

- · High accuracy and robust design
- Easy maintenance and reduced downtime due to bypass system
- Modular system enables flow rate changes and system extension
- Many industry interfaces available

Applications

- Pulp and paper industry
- Machine tools
- Metal industry
- Heavy industry

SKF Safeflow

SKF Safeflow flow meters control and indicate the flow rate in oil circulation lubrication systems. Each flow meter can be calibrated individually according to oil viscosity and desired flow. SKF Safeflow covers a flow rate of 0,04 to 56 l/min (0.08-118 pts/min) per lubrication point and can be banked (up to 10 units wide) to reduce piping and simplify installation. These flow meters offer excellent readability and visual monitoring due to their operating principle of straight glass flow tubes with internal calibration cones.

Features and benefits

- Easy and individual calibration of flow meters with adjustable flow rate
- SF05A, SF10A and SF15A can be combined in one module on request
- Common or individual electronic alarms available

Applications

- Pulp and paper industry
- Metal industry
- Power plants
- Mining

SKF Flowline Monitor

Description

The SKF Flowline Monitor is used to divide, measure and control the flow rate in oil circulation lubrication systems. Three different flow meter sizes enable control and monitoring of 0,1 to 100 l/min flows with operating viscosities from 32 to 1000 mm²/s. The flow meters operate individually and can be programmed and adjusted separately. Regardless of oil temperature and viscosity changes, the SKF Flowline Monitor provides accurate results. Computer configuration and remote monitoring are possible. Monitoring modules are available offering common alarms, individual alarms for each lubrication point and interfaces to process controls.

Features and benefits

- Extended product service life due to improved adjustment valve surface coating
- Minimal pressure loss due to turbine-based monitoring and adjusting-valve technology
- Easy-to-use interface
- Indication of flow accuracy of each lubrication point
- Modular monitoring capabilities
- Panel mounting possible

Applications

- Pulp and paper industry
- Metal industry
- Mining
- Power plants
- · Other industries and applications

SMBM-X (Single-flow)

The SMBM-X is a 1–6 outlets flow regulating valve with fixed output based on pressure balance. It is designed to divide main line flows into parallel, individual, volumetric flow quantities and to "limit" these according to requirements. The flow is generated independently of system pressure changes and virtually independently of viscosity, guaranteeing a constant flow. The SMBM-X provides a flow rate from 0,08 to 7,89 l/min (0.17–16.86 pts/min) and a pressure range of up to 200 bar (2 900 psi). It has three selectable built-in monitoring options, a gear-wheel-type flow indicator, a signal transmitter or a piston detector. All three monitoring options enable electronic monitoring of the current flow.

Features and benefits

- Effective monitoring of oil flow
- Self-adjusting metering with constant oil flow indipendent of back pressures
- Modular design with 3 different montoring options (gear meter, signal transmitter or piston detector)
- Wide viscosity range virtually independent of viscosity
- Ideal solution for small labyrinth sealed bearings
- ATEX versions available

Applications

- Pulp and paper industry
- Mining industry
- Heavy industry

SMBM-V (Dual-flow)

The SMBM-V is a 1–6 outlets flow regulating valve with fixed output based on pressure balance. It is designed to divide main line flows into parallel, individual, volumetric flow quantities and to "limit" these according to requirements. The flow is generated independently of system pressure changes and virtually independently of viscosity, guaranteeing a constant flow. The SMBM-V provides a flow rate from 0,08 to 7,98 l/min (0.17–16.86 pts/min) and a pressure range of up to 200 bar (2 900 psi). During start-up, the flow is reduced to 25% of the nominal flow, to avoid leakages in small labyrinth sealed bearings. It has three selectable built-in monitoring options, a gear-wheel-type flow indicator, a signal transmitter or a piston detector. All three monitoring options enable electronic monitoring of the current flow. SMBM-V is the technically optimized successor of SMB 7 and SMB 10.

Features and benefits

- Effective monitoring of oil flow
- Ideal solution for small labyrinth sealed bearings
- Dual flow design to enable start-up flow reduction
- Self-adjusting metering with constant oil flow indipendent of back pressures
- Modular design with 3 different montoring options (gear meter, signal transmitter or piston detector)
- · Wide viscosity range virtually independent of viscosity
- ATEX versions available

Applications

- Pulp and paper industry
- Heavy and mining industry

All oil flow rates related to the indicated nozzle sizes were determined for a service viscosity of 300 mm²/s at a temperature of 20 °C (68 °F). They are approximative values and may need to be adapted to different viscosities shown on SKF.com/SMBM or in publication 18872EN.

SMB₃

Description

The SKF SMB 3 flow limiter is designed to divide the main line flow into parallel, individual flows. The flow is generated independently of system pressure changes and virtually independently of viscosity, guaranteeing a constant flow. The SMB 3 provides a flow rate from 6 to 38 l/min (12.6–80.3 pts/min) and a pressure range of up to 200 bar. The flow limiter offers oil flow monitoring with a signal transmitter or piston detector. These indicators create a fault signal when the flow rate drops to approximately 85%. The SMB 3 flow limiter is a perfect soltution for applications with changing ambient temperatures and the need for a stable oil flow such as in oil circulation lubrication systems.

Features and benefits

- Stable oil flow rate regardless of pressure, temperature or viscosity changes
- No need for system pressure control, a pressure relief valve is sufficient
- Simple monitoring by signal transmitter
- Easy start-up with fixed flow rate via pre-selected nozzle sizes
- Adaptation of flow rates by plug-in nozzles
- High operating temperature up to +100 °C
- Optional ATEX version Ex II 3 cll CT6
- Extremely robust design

Applications

- Mining, Cement and Oil & Gas industry
- Metal forming, machine tools
- Pulp & Paper industry
- · Industrial gearboxes

SMB 13

Description

The SMB 13 flow limiter is designed to divide the main line flow into parallel, individual, volumetric flow quantities and to "limit" these according to requirements. The flow is generated independently of system pressure and virtually independently of viscosity, guaranteeing a constant flow. The SMB 13 provides a flow rate from 6 to 30 l/min (12.6–63.4 pts/min) and a pressure range up to 50 bar (725 psi). The flow limiter has a built-in, gear-wheel-type flow indicator for electronic and visual monitoring of oil flow. Every rotation creates a signal offering information about the flow rate. The SMB 13 flow limiter is a perfect solution for applications with changing ambient temperatures and the need for a stable oil flow such as in oil circulation lubrication systems.

Features and benefits

- Stable oil flow rate regardless of pressure, temperature or viscosity changes
- Visual and electronic monitoring with real flow indication
- Easy start-up with fixed flow rate via pre-selected nozzle sizes
- Adaptation of flow rates by plug-in nozzles
- Optional ATEX version for Ex II 2G c TX Gb, Ex II 2D c TX Db
- Optional connection to customer data control system
- · Extremely robust design

Applications

- Mining, Cement and Oil & Gas industry
- Metal forming, machine tools

Progressive metering device

PSG1

Description

The PSG1 is a progressive metering device consisting of a baseplate and different metering sections that can be individually combined for specific outlet ratios and cross portings. The ports are part of the baseplate, so that connectors and tubes remain in place when segments need to be changed.

Features and benefits

- Easy servicing as outlets are located on baseplate
- Flexible due to exchangeable metering segments
- Visual or electrical monitoring possible
- Dummy segments with no output available
- Adjustable by consolidating outlets internally or externally

Applications

- Automobile presses
- Paper machines
- Tunnel boring machines

PSG3

 \dots = to be configured in the section configurator below

VP

The VP type metering device is a sectional metering device. Its metering sections cover a metering volume per outlet and cycle of $0.1~\text{cm}^3$ (T-section = 2 outlets) to $1.2~\text{cm}^3$ (S-section = 1 outlet). All sections (inlet, intermediate, end) are tightened via tie rods. The delivery ducts are sealed by porting plates in between the segments. A minimum of three intermediate sections is necessary.

Features and benefits

- Volumetric flow of up to 1,0 l/min; 2.1 pts/min
- Universal use in continuous or intermittent operation
- Metering sections with variable metering amount
- · Internal and external consolidation of outlets
- Visual or electrical monitoring optional
- Ideal as main metering device
- All outlets with built-in, non-return valves

Applications

- Preferred master metering device
- · Metal forming machines
- Vehicles, trucks
- Construction and mining
- Packaging machines
- · General industry
- Farm machinery

Control unit

ST-2240-CIRC

The SKF Control Centre ST-2240-CIRC is a stand-alone controller for oil circulation lubrication systems. It comes with a touch screen and remote smart phone option. It is a flexible and cost-effective solution for controlling and monitoring oil circulation lubrication systems. It comes with an easy-to-use touch screen interface, machine interlocking and various communication protocol.

Features and benefits

- Automatic and manual pump change
- Control of output pressure, output oil temperature and oil reservoir heating and filter pressures
- · Automatic cold start-up mode
- By-pass valve control

Applications

- Oil circulation lubrication systems
- Pulp and paper industry
- Metals industry
- Mining, mineral processing and cement plants
- Power plants

Software

SKF Flowline Software

Description

The SKF Flowline Software is designed as a stand alone monitoring software for SKF Flowline Monitor flow meters. It collects and processes information on current states of all connected flow meters and records trends. A detailed visualization enables the operator to track down each alarm signal from the factory view to the individual panel and flow meter. The software provides detailed information on each lubrication point.

Features and benefits

- Full overview of all connected flow meters
- Traceability down to the lubrication point
- Compatibility with Canbus, Modbus, Profibus, Profinet

Applications

- Pulp and paper industry
- Metals industry
- Mining, mineral processing and cement

WS 32/33/35

Fill level switches monitor the fill level in non-pressurized fluid reservoirs. To meet different requirement, fill level switches either have one or two switching points. If fill level switches have one switching point (WS32), the minimum fill level in the reservoir is monitored. Fill level switches with two switching points either monitor the minimum and maximum fill levels in the reservoir so the filling stops automatically when the maximum level is reached (WS33), or they monitor the minimum fill level and have an early warning function (WS35). The latter version gives a signal before a critical oil level in the reservoir is reached so oil can be topped off before the machine stops working. Other fill level switches are available on request, e.g. with three switching points.

Features and benefits

- Easy mounting
- Different plug sizes
- Various switching points

Applications

- Machine tools
- Printing
- Automation

Flow monitor

171-210

Description

Flow monitors are minimum flow detector switches. They represent an inexpensive solution for the monitoring of smaller oil circulation lubrication systems or critical lubrication points in systems that generally are not equipped with individual flow monitoring.

Features and benefits

- · Effective monitoring of minimum oil flow
- Wide flow range
- · Available in five ranges but with identical outer dimensions
- High operating temperature

Applications

- Automotive industry
- · Metal forming
- Machine tools
- Heavy industry

SFZM

Description

The SFZM gear wheel indicator is an oil flow monitoring device. It offers robust flow monitoring of lubrication points even under harsh environmental conditions. Its gear wheel measuring principle is based on the flow limiter technology. SFZM flow meters have a compact design and have small installation dimensions. At the same time, they allow a wide range of flow rates from 0,09 l/min to 8,0 l/min. This allows the use in a wide variety of applications. SFZM gear wheel indicators can also be used as monitoring device for self-adjusting circuits.

Features and benefits

- Compact and light weight design
- Corrosion resistant, robust aluminum body
- Three versions with different resolutions from 3, 6 to 12 ml/pulse
- Sight glass for visual monitoring
- Upper-level process control connectivity
- Atex design available on request

Applications

- Pulp and paper, metals industry
- Automobile body presses
- Mining and mineral processing

SFZ

Description

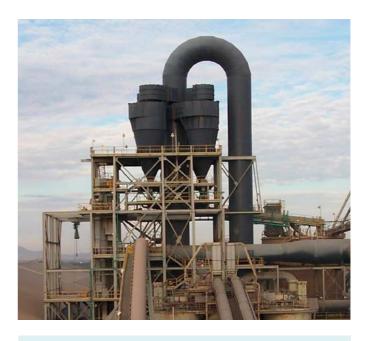

The SFZ product series offers robust flow monitoring even under harsh environmental conditions. Its gear-wheel measuring principle is based on the flow limiter technology.

Features and benefits

- Three designs with metering ranges from 0 to 180 l/min (0 to 380 pts/min)
- Robust aluminium body
- Sight glass for visual monitoring
- Gear-wheel-type measuring principle

Applications

- Pulp and paper industry
- Metals industry
- Mining
- Mineral processing
- Cement
- Automobile body presses

Pulse meter

IPM

Description

IPM is a digital pulse metering panel to monitor flow rates in oil circulation systems. It can be operated combined with flow meters or flow limiters. The intuitive IPM touch display allows field configuration and individual parameters for up to 45 lubrication points. Each point is monitored against nominal flow value but can also have a reduced set point for startup period preventing unnecessary alarms. Besides informative local alarm messages, the panel offers five relay outputs with 15 different alarm combinations. Thanks to its modular design, IPM is optionally available with customized ethernet connections. IPM offers an excellent upgrade possibility for existing oil flow monitoring systems having pulse feed or static signals.

Features and benefits

- Easy wiring and installation
- Adjustable system start-up mode
- · Upper-level process control connectivity
- Intuitive digital touch display with parameter set-up
- Real-time oil flow rate monitoring incl. alarm functions
- · Excellent upgrade for existing pulse meter systems
- Compatible with SMD, SMB, SMBM and SFZM oil flow metering devices

Applications

- Pulp and paper industry
- Mining, mineral processing and cement industry
- Automotive industry
- Food and beverage
- Metals industry

Filter

169-460-...

Description

SKF pressure filter series 169-460 are standard oil filters according to DIN 24550. They are modular in design with a filter housing (filter head/ filter body), a filter element and a screw plug. Optionally a dirt indicator can be selected instead of the screw plug. The pressure filters are used as line filters in the pipes of the CircOil lubrication system for separating solids from the fluids. Two kinds of filter elements are available. Fiberglass fleece – disposable elements based on inorganic fibers (absolute filtration) or wire fabric (nominal filtration). The dirt indicator monitors the filter element and signals when it needs to be replaced.

Features and benefits

- Prevents system or component failures and extends system live due to significant reduction of solids
- Economical, reliable and maintenance-friendly operation
- · Compact and modular design mountable directly into pipes
- Wide range of volumetric flow up levels and grades of filtration
- · Optimized service handling by replacing of filter elements only
- Dirt monitoring of filter elements as an option

Applications

- General mechanical and plant engineering
- Shipbuilding and offshore industry
- Pulp and paper industry
- Heavy industry

Volumetric flow up

20 bar; 290 psi
30 bar; 435 psi
40 l, 63 l, 100 l;

 $\begin{array}{c} 10.6, 16.6, 26.4 \ gal \\ \text{Filter ratings} & 3 \ \text{to} \ 50 \ \mu\text{m} \\ \text{Material:} \\ \text{Housing} & \text{Aluminum} \end{array}$

Sealing material FKM
Filter Fiberglass fleece-inorganic-absolute

filtration, wire fabric-stainless steel-nominal filtration

Connecting thread (ISO 228) G 1/2
Dimensions min. 92 × 82 × 186 mi

min. 92 × 82 × 186 mm max. 92 × 82 × 426 mm min. 3.62 × 3.3 × 7.32 in max. 3.62 × 3.3 × 16.77 in

Mounting position vertical

NOTE
